

Version control system VCS keeps track of all work and all changes in a set of text files, typically the implementation of a software project, and allows several, widely separated, developers to collaborate. System makes work easier to developers when working on several files and allows them to keep track of all changes that have occurred. System uses client/server architecture and allows users to connect remotely or have client and server on the same machine. Several users can work with system simultaneously. The system runs on Microsoft Windows platform.
